## Bad Design – Apple Magic Mouse

The Apple Magic Mouse, is a well-known mouse due to its minimalist looks however, this mouse has a very terrible way to charge it.

While we are charging the mouse the user ends up being uncapable of using it which makes no sense and the only way to work is to either wait for it to charge or use another mouse.

The solution to this problem is very simple, the charging port could just be int the front part of the mouse so the user is able to work while the mouse is charging.

Good Design – Slack

Slack is an application both for browser and desktop that allows users to communicate with each other through messages and also allows them to share files and other integration capabilities.

This app has a very intuitive interface mostly organized by topics or projects which ensures that discussions remain focused and are easily accessible.

The real-time messaging is user-friendly which allows a quick exchange and thread conversations both in a group or in private messages. The notifications ensure that the users are always informed about the important discussions without the need to unnecessary alerts.

Besides these, Slack also allows the user to customize his own workspace with multiple themes and layout options making it even more user-friendly.
